# What is a cognitive map?

A cognitive map derives from a walked way, a map that is drawn from your memory. It shows the subjective perception of the environment by the draughtsman.

The colours show the effectiveness of the interventions.

Pink marks suggestions for possible interventions found by you.

# Draw your cognitive map of a stroll in Rotterdam, Gdansk, Chur, Klagenfurt, Groningen, Coimbra, Zurich or Berne

## What you have to do

1. Scan the QR-Code for your city.
2. Follow the path that leads you along the stroll. Take your time to experience the city.
3. At the end of the walk, sit down and draw your path from memory: a cognitive map. Draw just what sticks in your remembrance. Leave the google map out of this task. Concentrate on what you remember from the walk. Draw as many details as possible on your individual map.

The evaluation task:

Give each location on your map a score between green and red that you think could be rated. This could be a stand of trees that cools down a place, an open paving that lets rainwater drain off well ... For this, draw a coloured circle on the map, like the circles on the right from green to red.

Subjective review

In this first step, you set these scores for locations on your walk map where you remember that climate improvement interventions should take place.

Evaluate the effectiveness of these existing interventions. Judge how you feel about the effectiveness of these interventions. Green indicates very efficient. Red indicates not efficient at all.

Street level interventions

In a second step, you set pink points where you could intervene as an individual.

Write what you could do.

the scores

Scan one of these QR-Tags and start walking and watching.  
You can do it in real world or even on street view.

Then, draw your cognitive map and score the interventions in pink like described above.

## your way throughout the city ...

Rotterdam

Chur

Gdansk

Klagenfurt

Groningen

Coimbra

Zurich

Berne
